Bottleneck to raising genetic yield potential

Substantial improvements in yield are possible:

- *CO₂ enrichment experiments*

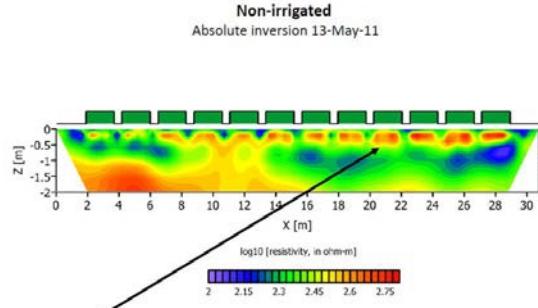

Hypothesis

Existing variation in photosynthetic capacity can be exploited to increase total biomass production by modern wheat cultivars

Context

- Soil
- Agronomy
- Weather
- Yield

Appears to show significantly reduced water content down to 0.5m, especially in the plots towards the end of the line.

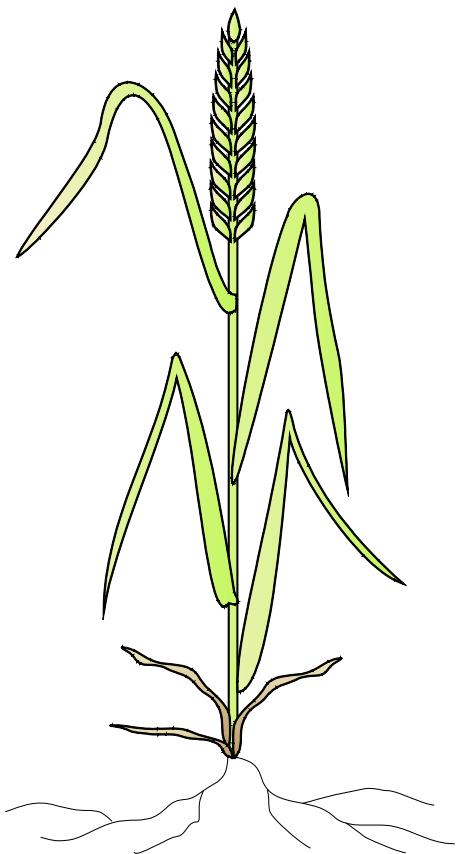

- **Interception of Radiation**
- **Duration of Photosynthesis**
- **Rate of photosynthesis**

Interception of Radiation

ROTHAMSTED
RESEARCH

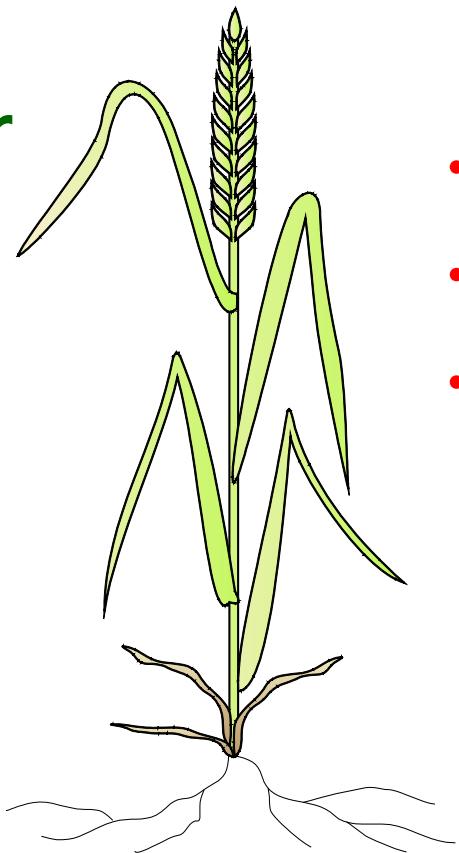

- Amount
- Composition
- Area
- Angle
- Tracking

- Leaf number
- Leaf size
- LAI
- Light interception

Duration

- Early ground cover
- Extended grain filling
- Stay green phenotype

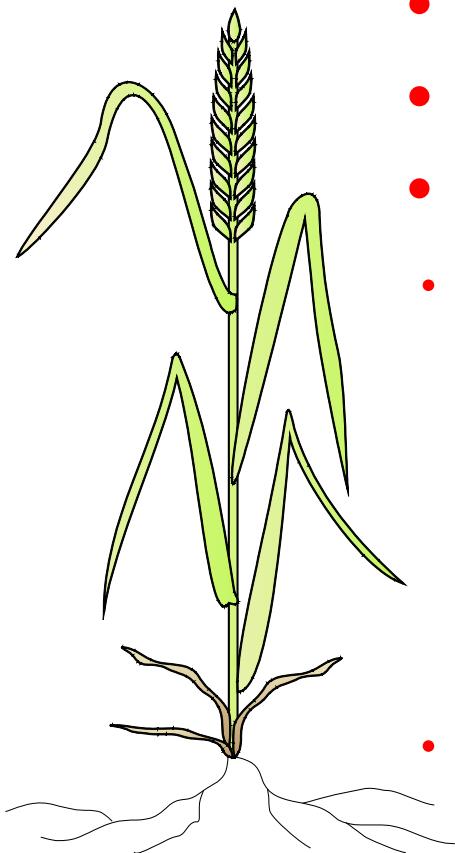

- Growth stage
- LAI
- Senescence

Capacity - physiological

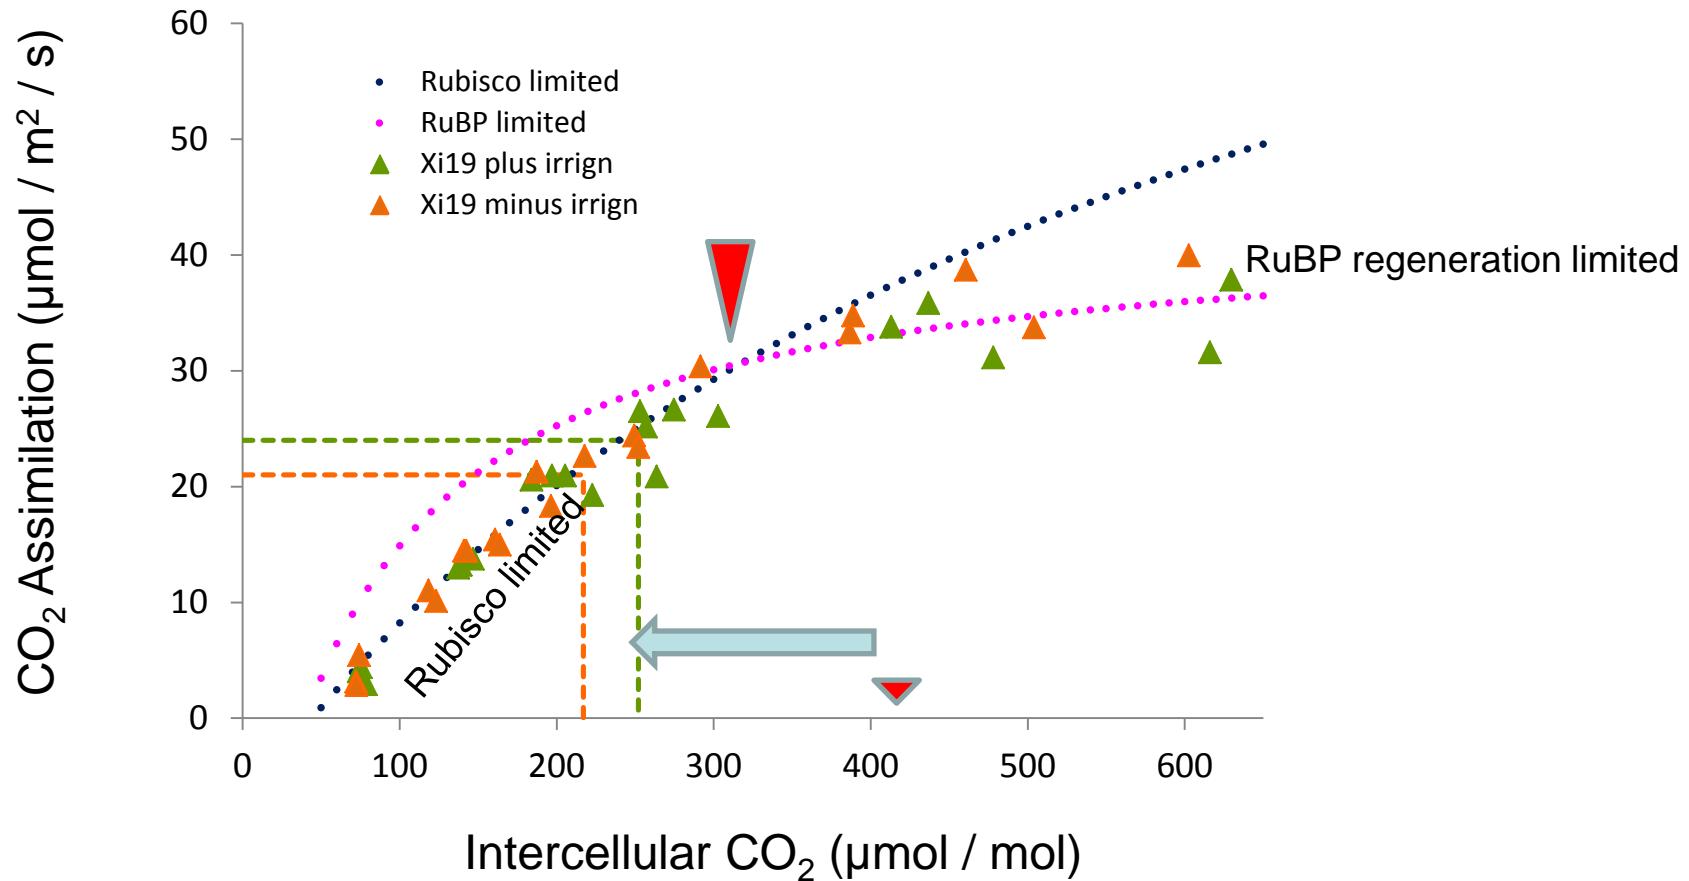

ROTHAMSTED
RESEARCH

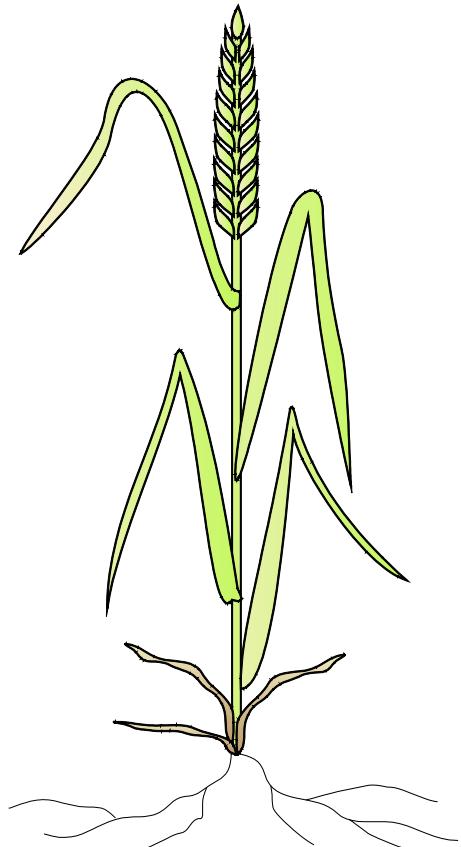

- Chlorophyll
- Rubisco content
- Rubisco activity

- SPAD
- Stomatal conductance
- Canopy temperature
- Fluorescence
 - Quantum yield
 - Max F yield
 - Fv/Fm
 - NPQ etc etc
- IRGA
 - Amax
 - Compensation point
 - Ci etc. etc.

Capacity - biochemical

- Chlorophyll content
- Rubisco amount
- Rubisco initial activity
- Rubisco total activity
- Rubisco maximal activity
- Rubisco Activation state
- RuBP
- C isotope
